Series 51-1
Bent Axis Variable
Displacement
Motors

Technical
Information

GENERAL DESCRIPTION

Series 51 and 51-1 variable displacement motors are bent axis design units, incorporating spherical pistons.

These motors are designed primarily to be combined with other products in closed circuit systems to transfer and control hydraulic power. Series 51 and 51-1 motors have a large maximum / minimum displacement ratio (5:1) and high output speed capabilities. SAE, cartridge, and DIN flange configurations are available.

A complete family of controls and regulators is available to fulfill the requirements of a wide range of applications.

Motors normally start at maximum displacement. This provides maximum starting torque for high acceleration.

The controls may utilize internally supplied servo pressure. They may be overridden by a pressure compensator which functions when the motor is operating in motor and pump modes. A defeat option is available to disable the pressure compensator override when the motor is running in pump mode.

The pressure compensator option features a low pressure rise (short ramp) to ensure optimal power utilization throughout the entire displacement range of the motor. The pressure compensator is also available as a stand-alone regulator.

- The series 51 and 51-1 motors – Advanced technology today
- The most technically advanced hydraulic units in the industry
- SAE, cartridge, and DIN flange motors
- Cartridge motors designed for direct installation in compact planetary drives
- Large displacement ratio (5:1)
- Complete family of control systems
- Proven reliability and performance
- Optimum product configurations
- Compact, lightweight

Series 51 and 51-1 Bent Axis Variable Displacement Motors
Technical Information
Notes

GENERAL SPECIFICATIONS

Most specifications for bent axis variable displacement motors are listed on these pages. For definitions of the various specifications, see the related pages in this publication. Not all hardware options are available for all configurations; consult the series 51 and 51-1 model code supplement or price book for more information.

General Specifications	
Motor type	Axial piston motor with variable displacement bent axis design.
Direction of rotation	Clockwise and counter-clockwise (bi-directional).
Installation position	Discretionary, the housing must always be filled with hydraulic fluid.
Other system requirements	Independent braking system, circuit overpressure protection, suitable reservoir.

SPECIFIC DATA

Specific Data							
			Frame size				
			060	080	110	160	250
Displacement maximum	V _{g_{max}}	cm ³ [in ³]	60.0 [3.66]	80.7 [4.92]	109.9 [6.71]	160.9 [9.82]	250.0 [15.26]
Displacement minimum	V _{g_{min}}	cm ³ [in ³]	12.0 [0.73]	16.1 [0.98]	22.0 [1.34]	32.2 [1.96]	50.0 [3.05]
Rated flow	Q	l/min [US gal/min]	216 [57]	250 [66]	308 [81]	402 [106]	550 [145]
Maximum flow	Q _{max}	l/min [US gal/min]	264 [70]	323 [85]	396 [105]	515 [136]	675 [178]
Maximum corner power	P corner max.	kW [hp]	336 [450]	403 [540]	492 [660]	644 [864]	850 [1140]
Weight (approx.)	m	kg [lb]	28 [62]	32 [71]	44 [97]	56 [123]	86 [190]
Mass moment of inertia of the internal rotating parts	J	kgm ² [lb·ft ²]	0.0046 [0.1092]	0.0071 [0.1685]	0.0128 [0.3037]	0.0234 [0.5553]	0.0480 [1.1580]
Type of mounting	Four (4) bolt flange, SAE or DIN-flange configuration. Two (2) bolt flange cartridge motor configuration.						
Pipe connections	Main pressure ports: SAE-flange. Remaining ports: SAE straight thread O-ring boss.						
Controls	N1, HZ, E1, E2, E7, F1, F2, T1, T2, TA, TH, EP, EQ, L1, L2, L7, D7, D8, HS						
Displacement limiter	All Series 51 motors incorporate mechanical minimum and maximum displacement limiters.						
Shaft configuration	Splined ANSI or DIN shaft.

FLUID SPECIFICATIONS

Temperature Range ¹⁾

	°C	[°F]	
Minimum	-40	[-40]	intermittent, cold start
Rated	104	[220]	
Maximum	115	[240]	intermittent

¹⁾ At the hottest point, normally the case drain port.

Viscosity

	mm ² /s	[SUS]	
Minimum	7	[49]	intermittent
Recommended operating range	12-80	[70-370]	
Maximum	1600	[7500]	intermittent cold start

Cleanliness Level and β_x -Ratio	
Required fluid cleanliness level	ISO 4406 Class 18/13
Recommended β_x -ratio for suction filtration	$\beta_{35-45}=75$ ($\beta_{10} \geq 2$)
Recommended β_x -ratio for charge pressure filtration	$\beta_{15-20}=75$ ($\beta_{10} \geq 10$)
Recommended inlet screen size for charge pressure filtration	100 μ m-125 μ m

DETERMINATION OF NOMINAL MOTOR SIZES

Metric System

Input flow: $Q_e = \frac{Vg \cdot n}{1000 \cdot \eta_v}$

Output torque: $M_e = \frac{Vg \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi}$

Output power: $P_e = \frac{M_e \cdot n}{9550} = \frac{Q_e \cdot \Delta p \cdot \eta_t}{600}$ kW

Speed: $n = \frac{Q_e \cdot 1000 \cdot \eta_v}{Vg}$

Vg = Motor displacement per rev.

Δp = $p_{HD} - p_{ND}$

η_v = Motor volumetric efficiency

η_{mh} = Motor mechanical-hydraulic
(Torque) efficiency

η_t = Motor total (overall) efficiency

p_{HD} = High pressure

p_{ND} = Low pressure

Inch System

l/min $Q_e = \frac{Vg \cdot n}{231 \cdot \eta_v}$ [US gal/min]

Nm $M_e = \frac{Vg \cdot \Delta p \cdot \eta_{mh}}{2 \cdot \pi}$ [lbf-in]

$P_e = \frac{Vg \cdot n \cdot \Delta p \cdot \eta_t}{396\,000}$ [hp]

$n = \frac{Q_e \cdot 231 \cdot \eta_v}{Vg}$ min⁻¹ (rpm)

cm³ [in³]

bar [psid]

bar [psid]

bar [psid]

CASE PRESSURE

Under normal operating conditions, case pressure must not exceed the **rated pressure**. Momentary case pressure exceeding this rating is acceptable under cold start conditions, but still must stay below the **maximum pressure** rating. The **minimum pressure** provides proper lubrication at high speeds. Operation with case pressure in excess of these limits may result in external leakage due to damage to seals, gaskets, and/or housings.

Case Pressure

	bar	[psi]
Rated pressure	3	[44.0]
Maximum pressure (cold start)	5	[73.0]
Minimum pressure (at rated speed)	1	[14.5]

SPEED RANGE

Rated Speed is the speed limit recommended at full power condition and is the highest value at which normal life can be expected.

Maximum Speed is the highest operating speed permitted and cannot be exceeded without reduction in the life of the product or risking immediate failure and loss of driveline power (which may create a safety hazard). In the range between rated and maximum speed please contact your Sauer-Danfoss representative.

Warning: The loss of hydrostatic drive line power in any mode of operation (e.g., forward, reverse, or "neutral" mode) may cause the loss of hydrostatic braking capacity. A braking system, redundant to the hydrostatic transmission must, therefore, be provided which is adequate to stop and hold the system should the condition develop.

Speed Limits						
		min ⁻¹ (rpm)				
Frame size		060	080	110	160	250
Rated speed	at max. disp.	3600	3100	2800	2500	2200
	at min. disp.	5600	5000	4500	4000	3400
Maximum speed ¹⁾	at max. disp.	4400	4000	3600	3200	2700
	at min. disp.	7000	6250	5600	5000	4250

¹⁾ Contact your Sauer-Danfoss representative for max. speed at displacements between max. and min. displacement.

Speed Limits

PRESSURE LIMITS

System pressure is the dominant operating variable affecting hydraulic unit life. High pressure, which results from high load, reduces expected life in a manner similar to the affects of high load on other mechanical assemblies such as engines and gear boxes. There are load-to-life relationships for the rotating group and for the shaft anti-friction bearings.

Continuous pressure is the pressure at which the hydrostatic system could operate continuously and still achieve acceptable hydrostatic life. This pressure level varies depending on operating speed, and on the life requirements for a particular application. While most mobile applications require system pressure to vary widely during operation, a "weighted average" pressure can be derived from a machine duty cycle. (A duty cycle is a means of quantifying the pressure and speed demands of a particular system on a percent time basis). Once a duty cycle has been determined or estimated for a specific application, contact your Sauer-Danfoss representative for system life ratings for the application.

Maximum delta pressure is the highest intermittent pressure allowed, and is the relief valve setting. It is determined by the maximum machine load demand. For most systems, the load should move at this pressure.

Maximum pressure is assumed to occur a small percentage of operating time, usually less than 2% of the total. Both the continuous and maximum pressure limits must be satisfied to achieve the expected life.

Minimum low pressure must maintained under all operating conditions to avoid cavitation.

System Pressure Range, Input

	bar	[psid]
Maximum delta pressure	480	[7000]
Minimum low pressure	10	[145]
Maximum pressure	510	[7400]

LOOP FLUSHING

An integral non-adjustable loop flushing valve is incorporated into all these motors. Installations that require fluid to be removed from the low pressure side of the system circuit because of cooling requirements or contamination removal will benefit from loop flushing.

The integral loop flushing valve is equipped with an orificed charge pressure relief valve designed with a cracking pressure of 16 bar [232 psi]. Valves are available with several orifice sizes to meet the flushing flow requirements of all system operating conditions.

The total system charge pump flow should be of sufficient volume to accommodate:

- The number of motors in the system
- System efficiency under worst case conditions
- Pump control requirements
- External needs

LOOP FLUSHING (continued)

Although charge pump sizing requires the consideration of many system variables, the following table gives a recommendation of what charge pump displacement may be required to accommodate the flushing flow of each available charge relief valve orifice.

Recommended Charge Pump Displacement							
Loop flushing valve	E4	E6	F0	F3	G0	G3	H0
Charge pump size (cm ³)	8	8	11	14	17 or 20	26	34, 47 or 65

Warning: The loss of hydrostatic drive line power in any mode of operation (e.g., forward, reverse, or “neutral” mode) may cause the loss of hydrostatic braking capacity. A braking system, redundant to the hydrostatic transmission must, therefore, be provided which is adequate to stop and hold the system should the condition develop.

Equation:

$$Q_{\text{Flush}} = \frac{Q_{\text{Charge}} - Q_{\text{Leak}}}{2 \cdot k_{\text{Mo}}}$$

Where:

- Q_{Flush} = flushing flow per motor
- Q_{Charge} = charge flow at operating speed
- k_{Mo} = number of motors fed by one pump
- Q_{Leak} = sum of external leakages including
 - motor leakage
 - pump leakage + internal consumers: 8 l/min [2.11 US gal/min] for displacement control pumps
 - or
 - for non-feedback controlled pumps at 200 bar [2900 psi]
 - external consumers (e.g. brakes, cylinders, and other pumps)

Series 51 and 51-1 Bent Axis Variable Displacement Motors

Technical Information

General Technical Specifications

MINIMUM DISPLACEMENT LIMITER

All Series 51 and 51-1 motors incorporate mechanical displacement limiters. The minimum displacement of the motor is preset at the factory with a set screw in the motor housing. A tamper-proof cap is provided.

HYDRAULIC FLUIDS

Ratings and data are based on operating with hydraulic fluids containing oxidation, rust and foam inhibitors. These fluids must possess good thermal and hydrolytic stability to prevent wear, erosion and corrosion of the internal components.

Fire resistant fluids are also suitable at modified operating conditions. Please see Sauer-Danfoss literature *Hydraulic Fluids and Lubricants Technical Information* for more information.

It is not permissible to mix hydraulic fluids. For more information contact your Sauer-Danfoss representative.

Suitable Hydraulic fluids:

- Hydraulic fluids per DIN 51 524, part 2 (HLP)
- Hydraulic fluids per DIN 51 524, part 3 (HVLP)
- API CD, CE and CF engine fluids per SAE J183
- M2C33F or G automatic transmission fluids (ATF)
- Agricultural multi purpose oil (STOU)
- Premium turbine oils
(for Premium turbine oils contact your Sauer-Danfoss representative).

TEMPERATURE AND VISCOSITY

Temperature and viscosity requirements must be concurrently satisfied. The data shown in the tables assume petroleum-based fluids, are used.

The high temperature limits apply at the hottest point in the transmission, which is normally the motor case drain. The system should generally be run at or below the **rated temperature**. The **maximum temperature** is based on material properties and should never be exceeded.

Cold oil will generally not affect the durability of the transmission components, but it may affect the ability to flow oil and transmit power; therefore temperatures should remain 16 °C [30 °F] above the pour point of the hydraulic fluid. The **minimum temperature** relates to the physical properties of component materials.

For maximum unit efficiency and bearing life the fluid viscosity should remain in the **recommended operating range**. The **minimum viscosity** should be encountered only during brief occasions of maximum ambient temperature and severe duty cycle operation. The **maximum viscosity** should be encountered only at cold start.

Heat exchangers should be sized to keep the fluid within these limits. Testing to verify that these temperature limits are not exceeded is recommended.

TEMPERATURE AND VISCOSITY (continued)

Temperature Range ¹⁾

	°C	[°F]	
Minimum	-40	[-40]	intermittent, cold start
Rated	104	[220]	
Maximum	115	[240]	intermittent

¹⁾ At the hottest point, normally the case drain port.

Viscosity

	mm ² /s	[SUS]	
Minimum	7	[49]	intermittent
Recommended operating range	12-80	[70-370]	
Maximum	1600	[7500]	intermittent cold start

FLUID AND FILTRATION

To prevent premature wear, it is imperative that only clean fluid enter the hydrostatic transmission circuit. A filter capable of controlling the fluid cleanliness to ISO 4406 Class 18/13 (SAE J1165) or better under normal operating conditions is recommended.

The filter may be located either on the inlet (suction filtration) or discharge (charge pressure filtration) side of the charge pump. The selected filtration system must maintain a cleanliness level of 18/13 per ISO 4406.

The selection of a filter depends on a number of factors including the contaminant ingress rate, the generation of contaminants in the system, the required fluid cleanliness, and the desired maintenance interval. Filters are selected to meet the above requirements using rating parameters of efficiency and capacity.

Filter efficiency may be measured with a Beta ratio ¹⁾ (β_x). For simple suction-filtered closed circuit transmissions and open circuit transmissions with return line filtration, a filter with a β -ratio within the range of $\beta_{35-45} = 75$ ($\beta_{10} \geq 2$) or better has been found to be satisfactory. For some open circuit systems, and closed circuits with cylinders being supplied from the same reservoir, a considerably higher filter efficiency is recommended. This also applies to systems with gears or clutches using a common reservoir. For these systems, a charge pressure or return filtration system with a filter β -ratio in the range of $\beta_{15-20} = 75$ ($\beta_{10} \geq 10$) or better is typically required.

Since each system is unique, the filtration requirement for that system will be unique and must be determined by test in each case. It is essential that monitoring of prototypes and evaluation of components and performance throughout the test program be the final criteria for judging the adequacy of the filtration system. Please see Sauer-Danfoss literature *Hydraulic Fluids and Lubricants Technical Information* for more information.

¹⁾ Filter β_x -ratio is a measure of filter efficiency defined by ISO 4572. It is defined as the ratio of the number of particles greater than a given diameter ("x" in μm) upstream of the filter to the number of these particles downstream of the filter.

Cleanliness Level and β_x -Ratio	
Required fluid cleanliness level	ISO 4406 Class 18/13
Recommended β_x -ratio for suction filtration	$\beta_{35-45} = 75$ ($\beta_{10} \geq 2$)
Recommended β_x -ratio for charge pressure filtration	$\beta_{15-20} = 75$ ($\beta_{10} \geq 10$)
Recommended inlet screen size for charge pressure filtration	100 μm -125 μm

INDEPENDENT BRAKING SYSTEM

Warning: The loss of hydrostatic drive line power in any mode of operation (e.g., forward, reverse, or "neutral" mode) may cause the loss of hydrostatic braking capacity. A braking system, redundant to the hydrostatic transmission must, therefore, be provided which is adequate to stop and hold the system should the condition develop.

RESERVOIR

The function of the reservoir is to remove air and to provide make up fluid for volume changes associated with fluid expansion or contraction, possible cylinder flow, and minor leakage.

The reservoir should be designed to accommodate maximum volume changes during all system operating modes and to promote deaeration of the fluid as it passes through the tank.

A minimum reservoir volume equal to 1/2 to 1 1/2 times charge pump flow/min is suggested. This allows 30 seconds fluid dwell for removing entrained air at the maximum return flow. This is usually adequate to allow for a closed reservoir (no breather) in most applications. The reservoir outlet to the charge pump inlet should be above the bottom of the reservoir to take advantage of gravity separation and prevent large foreign particles from entering the charge inlet line.

The reservoir inlet (fluid return) should be positioned so that the flow to the reservoir is discharged below the normal fluid level, and also directed into the interior of the reservoir for maximum dwell and efficient deaeration.

MOTOR BEARING LIFE

The rated motor bearing life, L_{h10} , shown in the table below, is based on a 90 % survival rate of shaft bearings, when operating at a speed of $n = 1500 \text{ min}^{-1}$ (rpm) with a charge pressure of 20 bar [290 psi] and without external shaft load.

Contact your Sauer-Danfoss representative for bearing life values at other pressures and angles.

Lifetimes for speeds other than 1500 min^{-1} (rpm) can be calculated from:

$$L_2 = \frac{L_1 \cdot 1500 \text{ min}^{-1} (\text{rpm})}{n_2} \quad \text{h}$$

$$L_1 = \text{Rated } L_{h10} \text{ life at } 1500 \text{ min}^{-1} (\text{rpm})$$

$$n_2 = \text{Operating speed} \quad \text{min}^{-1} (\text{rpm})$$

L _{h10} - Bearing Life (hours)

EXTERNAL SHAFT LOADS

Series 51 and 51-1 motors are designed with bearings that can accept external radial and thrust loads.

The external radial shaft load limits are a function of the load position, the load orientation, and operating conditions of the unit.

EXTERNAL SHAFT LOAD ORIENTATION

SAE-Flange design per ISO 3019/1

DIN-Flange design per ISO 3019/2

Cartridge Flange design

P001 166E

EXTERNAL SHAFT LOAD ORIENTATION (continued)

The table below provides the following information:

- The maximum allowable radial load (**Fr**) based on the distance (x_1) from the mounting flange to the load.
- The maximum allowable axial load (**Fa**).
- The actual distance of (**Fr**) for a given application from the mounting flange to the load is (x_2).
- **A** is the basic distance.
- **Fa/Δp** ratio of allowable axial load, dependent upon system pressure.

The values in the table are maximum values, and are not allowed under continuous load conditions.

Radial and Thrust Loads to the Output Shaft					060	080	110	160	250
Frame size									
Maximum allowable radial load	Fr	N [lbf]			10 000 [2248]	12 000 [2698]	14 000 [3147]	18 000 [4047]	26 000 [5845]
Distance from the SAE-mounting flange	x_1	mm [in]			33.6 [1.32]	33.6 [1.32]	62.7 [2.47]	52.7 [2.07]	45.3 [1.78]
Distance from the DIN-mounting flange	x_1	mm [in]			57.2 [2.25]	57.6 [2.27]	94.7 [3.73]	84.7 [3.33]	—
Distance from the Cartridge design mounting flange	x_1	mm [in]			117.6 [4.63]	136.1 [5.36]	177.5 [7.00]	—	—
Basic distance	A	mm [in]			25.2 [0.99]	25.6 [1.01]	54.7 [2.15]	44.7 [1.76]	37.3 [1.47]

— = not available

**ALLOWABLE EXTERNAL
 SHAFT LOAD, WHEN
 SHAFT LOAD DISTANCE
 IS DIFFERENT FROM
 STANDARD**

Use this formula to calculate maximum allowable radial load when max. shaft load distance (X_2) is different from (X_1):

Note:

(X_2) is the actual distance of (**Fr**) from the mounting flange to the load for a given application. If $X_2 < X_1$, (**Fr**) could also be calculated by the first equation, but in addition the bearing life has to be checked.

Contact your Sauer-Danfoss representative for load ratings of specific shafts or when the load orientation deviates more than 35° in either direction from the optimum.

Metric System:

$$X_2 > X_1 \quad Fr = \frac{M \cdot 10^3}{A - X_1 + X_2} \quad N$$

Inch System:

$$X_2 > X_1 \quad Fr = \frac{M \cdot 12}{A - X_1 + X_2} \quad lbf$$

Metric or Inch System:

$$X_2 > X_1 \quad Fr = Fr \text{ max } N \quad lbf$$

EFFICIENCY GRAPHS AND MAPS

This graph provides the volumetric and overall efficiencies for a typical Series 51 and 51-1 motor operating at maximum displacement, system pressures of 210 and 420 bar [3050 and 6090 psi], and a fluid viscosity of 8.2 mm²/s [53 SUS]. These efficiencies can be used for all frame sizes.

Overall efficiency and volumetric efficiency at maximum displacement

This graph shows typical overall efficiencies for Series 51 and 51-1 motors operating at maximum displacement and system pressures up to 420 bar [6090 psi], and a fluid viscosity of 8.2 mm²/s [53 SUS]. These efficiencies can be used for all frame sizes.

Overall efficiency at maximum displacement

Technical Information

General Technical Specifications

EFFICIENCY GRAPHS AND MAPS (continued)

This graph shows typical overall efficiencies for Series 51 and 51-1 motors operating at 30% of maximum displacement and system pressures up to 420 bar [6090 psi], and a fluid viscosity of 8.2 mm²/s (53 SUS).

These efficiencies can be used for all frame sizes.

Overall efficiency and volumetric efficiency at 30% of maximum displacement

This graph shows typical overall efficiencies for Series 51 and 51-1 motors operating at 30% of maximum displacement and system pressures up to 420 bar [6090 psi], and a fluid viscosity of 8.2 mm²/s (53 SUS).

These efficiencies can be used for all frame sizes.

Overall efficiency at 30% of maximum displacement

SPEED SENSOR

An optional speed sensor for direct measurement of speed is available. This sensor may also be used to sense the direction of rotation.

A special magnetic speed pick-up ring is pressed onto the outside diameter of the shaft and a Hall effect sensor is located in the motor housing. The sensor accepts supply voltage and outputs a digital pulse signal in response to the speed of the ring. The output changes its high/low state as the north and south poles of the permanently magnetized speed ring pass by the face of the sensor. The digital signal is generated at frequencies suitable for microprocessor based controls.

The sensor is available with different connectors (see below).

The SAE and DIN flange motors use a flat end speed sensor. The cartridge flange motors use a conical end speed sensor.

Contact your Sauer-Danfoss representative for more information.

Data Magnetic Speed Pick-up Ring					
Frame Size	060	080	110	160	250
Pulse/Rev	45	49	54	61	71

Technical Data Speed Sensor	
Supply voltage ¹⁾	4.5-8.5 V _{DC}
Supply voltage regulated	15 V _{DC max.}
Required current	12 mA at 5 V _{DC} (no load)
Max. current	20 mA at 5 V _{DC} and 1 Hz
Max. frequency	15 kHz
Voltage "high"	Supply voltage -0.5 V _{min.}
Voltage "low"	0.5 V _{DC max.}
Temperatur range	-40 to 110 °C [-40 to 230 °F]

Connecting pin designation:

Pin 1 or A : Supply voltage
Pin 2 or D : Direction of rotation
Pin 3 or B : Speed signal, digital
Pin 4 or C : Gnd common

¹⁾ It is not acceptable to energize the 4.5-8.5 V_{DC} speed sensor with 12 V_{DC} battery voltage; it must be energized by a regulated power supply. If it is desirable to energize the sensor with battery voltage, contact your Sauer-Danfoss representative for an optional speed sensor.

Control Operation TA**

Pressure Compensator Configuration: TACA with Hydraulic Brake Pressure Defeat

A shuttle valve ahead of the pressure compensator prevents operation in the deceleration direction (when motor is running in pump mode). This is designed to prevent rapid or uncontrolled deceleration while the vehicle/machine is slowing down.

The shuttle valve must be controlled by a 2-line external signal, based on direction of motor rotation, based on the following table.

Pressure Compensator Operation			
Rotation	High pressure port	Control pressure on port	PCOR-Function
CW	A	XA	yes
CW	A	XB	no
CCW	B	XA	no
CCW	B	XB	yes

Differential control pressure between port XA/XB

$\Delta p_{\min} = 0.5 \text{ bar [7 psi]}$

$\Delta p_{\max} = 50 \text{ bar [725 psi]}$

Pressure compensator override with brake pressure defeat is mainly used in systems with pumps having electric or hydraulic proportional controls or automotive controls.

Pressure Compensator Configuration: TAD1, TAD2, TAD7 with Electric Brake Pressure Defeat

A solenoid-switched valve ahead of the pressure compensator prevents operation in the deceleration direction (when motor is running in pump mode). This is designed to prevent rapid or uncontrolled deceleration while the vehicle/machine is slowing down.

The solenoid valve must be controlled by an external electric signal, based on direction of motor rotation, based on the following table.

**ELECTROHYDRAULIC
 TWO-POSITION
 CONTROL – OPTIONS**

T1, T2**, T7****

FOR 51-1

**FRAME SIZE
 060, 080, 110**

Circuit Diagram–Motor with Electrohydraulic Two-Position Control T1, T2**, T7****

Ports:

- A, B = Main pressure lines
- L1, L2 = Drain lines
- M3, M4 = Gage port servo pressure
- XA, XB = Control pressure ports,
brake pressure defeat
- T3 = Optional orifices
- N = Speed sensor

Electrohydraulic Two-Position Control T1, T2**, T7****

Displacement can be changed electrohydraulically under load from minimum displacement to maximum displacement and vice versa, by using a solenoid. When the solenoid is energized the motor has maximum displacement and the pressure compensator does not function.

- Solenoid not energized = minimum displacement
- Solenoid energized = maximum displacement

Pressure Compensator Override (PCOR)

The control can be overridden by PCOR using high loop pressure.

When the PCOR activates, the motor displacement increases toward maximum. Pressure ramp from PCOR start pressure (with motor at minimum displacement) until maximum displacement is reached is less than 10 bar [145 psi]. This ensures optimal power utilization throughout the entire displacement range of the motor.

PCOR start pressure is adjustable from 110 to 370 bar [1600 to 5370 psi].

Not all control options are shown in this Technical Information.
 Contact your Sauer-Danfoss representative for special control functions.

ELECTROHYDRAULIC TWO-POSITION CONTROL – OPTIONS

T1, T2**, T7****

FOR 51-1

**FRAME SIZE
060, 080, 110
(continued)**

Control Operation T1**, T2**, T7**

Pressure Compensator Configuration: T*CA with Hydraulic Brake Pressure Defeat

A shuttle valve ahead of the pressure compensator prevents operation in the deceleration direction (when motor is running in pump mode). This is designed to prevent rapid or uncontrolled deceleration while the vehicle/machine is slowing down.

The shuttle valve must be controlled by a 2-line external signal, based on direction of motor rotation, based on the following table.

Pressure Compensator Operation			
Rotation	High pressure port	Control pressure on port	PCOR-Function
CW	A	XA	yes
CW	A	XB	no
CCW	B	XA	no
CCW	B	XB	yes

Differential control pressure between port XA/XB

$\Delta p_{\min} = 0.5 \text{ bar [7 psi]}$

$\Delta p_{\max} = 50 \text{ bar [725 psi]}$

Pressure compensator override with brake pressure defeat is mainly used in systems with pumps having electric or hydraulic proportional controls or automotive controls.

Pressure Compensator Configuration: T*D1, T*D2, T* D7 with Electric Brake Pressure Defeat

A solenoid-switched valve ahead of the pressure compensator prevents operation in the deceleration direction (when motor is running in pump mode). This is designed to prevent rapid or uncontrolled deceleration while the vehicle/machine is slowing down.

The solenoid valve must be controlled by an external electric signal, based on direction of motor rotation, based on the following table.

Not all control options are shown in this Technical Information.

Contact your Sauer-Danfoss representative for special control functions.

Maximum allowable Control Pressure (Port X1):

$$p_{\text{max allowable}} = \text{Control start pressure} + 50 \text{ bar [725 psi]}$$

Control Operation HZB1

Control Start	
Control start range (adjustable)	
bar	[psi]
3 to 5	[44 to 73]
5 to 12	[73 to 175]
12 to 30	[175 to 435]

Control Ramp	
Control ramp range from max. to min. displ. (control pressure rise)	
bar	[psi]
7	[102]
14	[206]

Two-position control, option HZB1 see page 29.

Not all control options are shown in this Technical Information.

Contact your Sauer-Danfoss representative for special control functions.

mm
[in]

Shaft Spline Data			
Shaft option	S1		C6
Dimension	mm	[in]	mm [in]
Number of teeth	14		21
Pitch	12/24		16/32
Pressure angle	30°		
Spline	ANSI B92.1-1970 class 5 flat root side fit		
Pitch dia	29.633	[1.167]	33.337 [1.312]
Ø A	31.15	[1.23]	34.43 [1.36]
B	37.50	[1.48]	37.50 [1.48]
C	47.50±0.5	[1.87]	47.50±0.5 [1.87]
Ø D	25.80	[1.02]	30.00 [1.18]
E	50.30±1.2	[1.98]	50.30±1.2 [1.98]
F	55.50±0.7	[2.19]	55.50±0.7 [2.19]
Ø G	0.4375-14UNC-2B [7/16-14UNC-2B] allowed torque in thread max. 91 Nm [805 lbf·in]		
H	28.00	[1.10]	28.00 [1.10]

Flow into port **A** results in **CW** rotation of output shaft.

Flow into port **B** results in **CCW** rotation of output shaft.

Shaft rotation is determined by viewing from shaft end.

Ports with O-ring seal and inch threads shall be in accordance with ISO 11926/1.

Split flange boss A and B per ISO 6162 is identical with high pressure series SAE J518 code 62 (6000 psi).

Contact your Sauer-Danfoss representative for specific installation drawings.

Shaft Options – 51C160

mm
[in]

P001 820F

Shaft Spline Data			
Shaft option	D4		D5
Dimension	mm	[in]	mm [in]
Number of teeth	21		24
Spline	W45x2x30x21x9g side fit DIN 5480		W50x2x30x24x9g side fit DIN 5480
Pitch dia	42.000	[1.654]	48.000 [1.890]
Ø A	44.60	[1.76]	49.60 [1.95]
B	42.00	[1.65]	47.00 [1.85]
C	50.00±0.5	[1.97]	55.00±0.5 [2.17]
Ø D	40.00	[1.57]	45.00 [1.77]
E	54.50±1.4	[2.15]	59.50±1.4 [2.34]
F	194.90±0.6	[7.67]	199.90±0.6 [7.87]
Ø G	M12x1.75 allowed torque in thread max. 115 Nm [1018 lbf·in]		
H	30.00	[1.18]	30.00 [1.18]

Flow into port **A** results in **CW** rotation of output shaft.

Flow into port **B** results in **CCW** rotation of output shaft.

Shaft rotation is determined by viewing from shaft end.

Ports with O-ring seal and inch threads shall be in accordance with ISO 11926/1.

Splite flange boss A and B per ISO 6162 is identical with high pressure series SAE J518 code 62 (6000 psi).

Contact your Sauer-Danfoss representative for specific installation drawings.

V = SAE-flange, D = DIN-flange, C = Cartridge-flange

— = not available

Shaft rotation is determined by viewing from shaft end.

Ports with O-ring seal and inch threads shall be in accordance with ISO 11926/1.

Split flange boss A and B per ISO 6162 is identical with high pressure series SAE J518 code 62 (6000 psi).

Contact your Sauer-Danfoss representative for specific installation drawings.

OUR PRODUCTS

Hydrostatic transmissions
Hydraulic power steering
Electro-hydraulic power steering
Electric power steering
Closed and open circuit axial piston pumps and motors
Electro motors
Gear pumps and motors
Bent axis motors
Radial piston motors
Orbital motors
Transit mixer drives
Planetary compact gears
Proportional valves
Directional spool valves
Cartridge valves
Hydraulic integrated circuits
Hydrostatic transaxles
Integrated systems
Fan drive systems
Electrohydraulic controls
Digital electronics and software
Battery powered inverter
Sensors

Sauer-Danfoss Hydraulic Power Systems – Market Leaders Worldwide

Sauer-Danfoss is a comprehensive supplier providing complete systems to the global mobile market.

Sauer-Danfoss serves markets such as agriculture, construction, road building, material handling, municipal, forestry, turf care, and many others.

We offer our customers optimum solutions for their needs and develop new products and systems in close cooperation and partnership with them.

Sauer-Danfoss specializes in integrating a full range of system components to provide vehicle designers with the most advanced total system design.

Sauer-Danfoss provides comprehensive worldwide service for its products through an extensive network of Authorized Service Centers strategically located in all parts of the world.
